

BRAIN MRI REPORT

Patient Name: Test Patient
Age / Gender: 35 / Male
Study: MRI Brain (Plain + Contrast)

Findings:

MRI images reveal a well-defined hyperintense lesion in the left frontal lobe measuring approximately 3.2 x 2.8 x 3.0 cm. Surrounding perilesional edema is noted. Post-contrast images show heterogeneous enhancement.

Impression:

MRI findings are suggestive of a primary brain tumor, likely Glioma. Clinical correlation and histopathological confirmation are advised.

Note: This is a sample test report generated for academic/project evaluation purposes only.
